

WHAT'S GOING DOWN THE DRAIN?

Floor drains in commercial facilities can get pretty filthy. And if there's one pest that loves filth, it's the fly. Small flies in particular will seek out the buildup of grease and other organic material as a source of food and a breeding site.

DRAIN RISKS

- Food, grease and other organic matter builds up in the drain and underneath the drain cover, creating foul odours that signal to flies a meal is nearby.
- Drains can become a passageway for pests to enter your building or facility.

SMALL FLIES ARE BAD FOR BUSINESS

- Small flies reproduce quickly, leading to hundreds of flies if unresolved.
- They are difficult to control because they can lay eggs in hard to reach areas like inside drain pipes.
- Some species can transmit disease and contaminate food.

WHAT YOU CAN DO

- Check and clean drains periodically with a biological drain cleaner, like Orkin Actizyme®.
- Install drain traps that allow for water to flow while minimizing odours and pests.
- Wash floors at least daily.

ORKIN ACTIZYME FLOOR AND DRAIN CLEANER

Designed to eliminate foul odours, grease and grime without using harsh chemicals, Orkin Actizyme:

- Is a safe and effective cleaning solution that breaks down the toughest residue.
- Uses naturally occurring enzymes and beneficial bacteria to dissolve organic buildup that attracts pests like small flies.
- Is an environmentally friendly and effective approach that can be used to clean floors, drains and pipes.

Call Orkin Canada today to learn how you can scrub out small flies and improve drain maintenance.
